Coding Assignment

Instructions and Prerequisites

Exercise

It was a pleasure meeting you during the interview. We would be happy to invite you to our next step of candidate selection process - an online exercise.

The Exercise

You are kindly asked to participate in a coding session which will assess your skills as a Python developer. Our assignment is designed for engineers at any level of experience and we expect that your deliverable would be compliant with your level of expertise and industry standards.

The exercise will be carried out as a Zoom session where we would ask you to code a solution to a real-life business problem.

Prerequisites

Please read carefully through so that you are well prepared for our session

- The assignment is based upon Python (3+)
- You should prepare your own IDE and development setup, it should have internet access and you would be asked to present the screen via Zoom
- You should be able to execute your code and share the output via Zoom
- You can use Google search, Copilot and any other tools which you are familiar with and help you code better. Make sure to prepare your toolbox in advance

Time frame

Approximately 1.5 hours (Online via Zoom)

Please be on time

What Else?

1. You can ask as many questions as you want during the session
2. It's not about speed, you might not finish all assignments and in the given time frame yet be successful in the task from our point of view

Your Task

You are given two dataset containing business names and locations. (Provided as CSV files you may download). One list was provided by a client of ours, the second one is an extract of our internal database.

Your task is to match the records in both files by BOTH address and name
(i.e – produce a single CSV where each line has the ids of both matched records).

Example

Here is an example of two records that should have been matched. Note the business names and addresses in the two records:

Dataset 1:

id	name1	name2	name3	street	city	zip
657b8274fba2	MLK GAS STATION	TTVV CORP	MLK GAS STATION	1515 W MARTIN LUTHER KING JR BLVD	LOS ANGELES	900621743

Dataset 2:

id	address	name
5bd45bec9dff2f34a31d87fc60c5529c	1515 W Martin Luther King Jr Blvd, Los Angeles, CA 90062	Mlk Gas Station 0

In this case, your output shall look like this:

id_1	id_2
657b8274fba2	5bd45bec9dff2f34a31d87fc60c5529c
